

Python

The Key to Automated Design

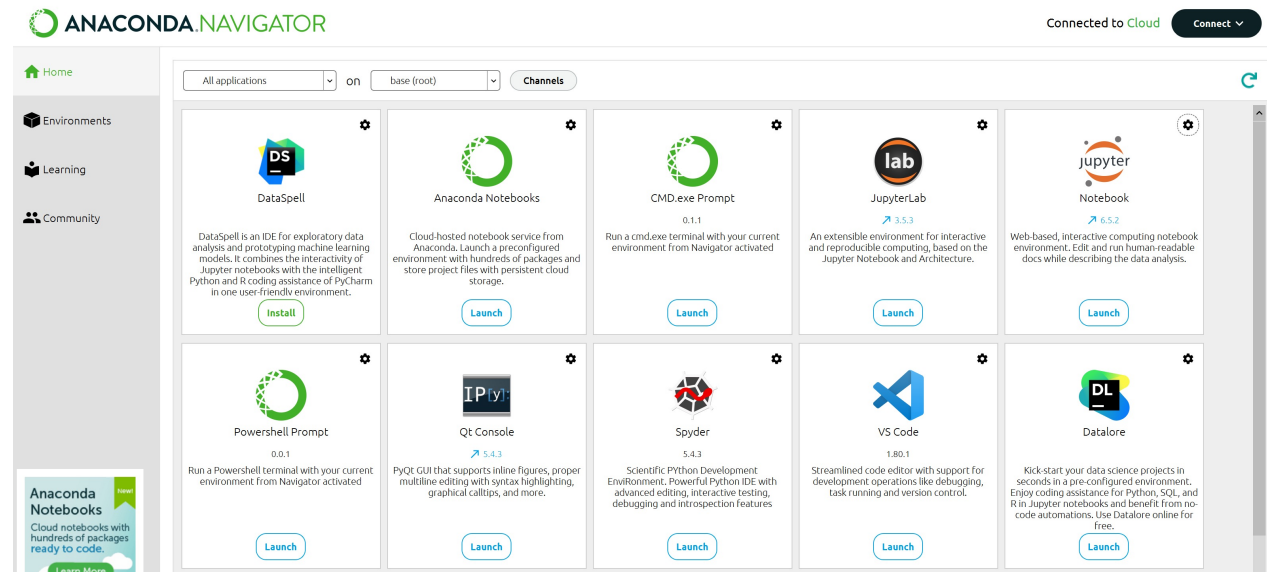

Paul Scott

Getting Started in Python

This document will explain the main apps you will need for your Python journey and how to use them.

There are 3 primary apps that you will be using:

- + Anaconda
- + Visual Studio Code (VS Code)
- + Jupyter Notebooks

Anaconda – Contains all the Python apps and setup installation you will need

VS Code – Where you will be coding

Jupyter Notebook – Where you will learn Python

Anaconda

Anaconda is the simplest way to install what you'll need to run Python on your PC.

Installation –

<https://www.anaconda.com/download#downloads>

This will install all the apps you will need, including VS Code and Jupyter Notebooks.

These apps will then be accessible through your Windows Search, or by opening Anaconda Navigator.

A dark blue banner with green wavy lines on the right side. The text 'Anaconda Distribution' is in green at the top left. Below it, 'Free Download' is in large white font. Underneath, a white sentence reads 'Everything you need to get started in data science on your workstation.' A list of four green checkmarks follows: 'Free distribution install', 'Thousands of the most fundamental DS, AI, and ML packages', 'Manage packages and environments from desktop application', and 'Deploy across hardware and software platforms'. At the bottom, there are two green buttons: 'Start Coding Now' with a cloud icon and 'Download' with a Windows icon. Below these buttons, the text 'Get Additional Installers' is followed by icons for Windows, Apple, and Linux.

Anaconda Distribution

Free Download

Everything you need to get started in data science on your workstation.

- ✓ Free distribution install
- ✓ Thousands of the most fundamental DS, AI, and ML packages
- ✓ Manage packages and environments from desktop application
- ✓ Deploy across hardware and software platforms

Jupyter Notebook

Jupyter Notebooks are a handy web-based environment to combine written text with executable Python code, perfect for tutorials.

They are the environment that the course 'Structural Engineer's Python Book' is run.

Jupyter Notebooks are denoted by the '.pynb' extension. To run, open Jupyter Notebook from Windows Search or Anaconda Navigator, and navigate to the notebook through the file explorer.

Save tutorial notebooks in your OneDrive to access them through Jupyter.

When working on a Jupyter Notebook, run code sections with the button on the left of the section, or by hitting 'Shift' + 'Enter'. This is how you may see the output of coded sections.

Code sections are not independent. If they use items from a previous section, they must be run in the correct order. Jupyter shows the order in which sections have been run to help you with this.

See 'Additional Notes on Jupyter Notebooks' for more information.

Run Options

Run Counter

Note: Jupyter code may be edited in-place. As you progress through the course, have a play with the code shown in examples to get a hands-on feel for how Python works.

Example

```
In [1]: timber_type = 'C24 Softwood'
f_c0k = 24 # N/mm2
FoS = 1.3
```

Printing Results

When a Python script runs, it runs in the background and won't tell us anything unless we ask it to (annoying for very short scripts but extremely useful if your script gets longer and you only need certain info)

If we want to see an output (Eg. A calculation result, the name of a variable etc.) we can tell Python to 'print' what we want to see, and it will show up in the IDE console/terminal.

To print something, use the following command:

```
print(what we want to print)
```

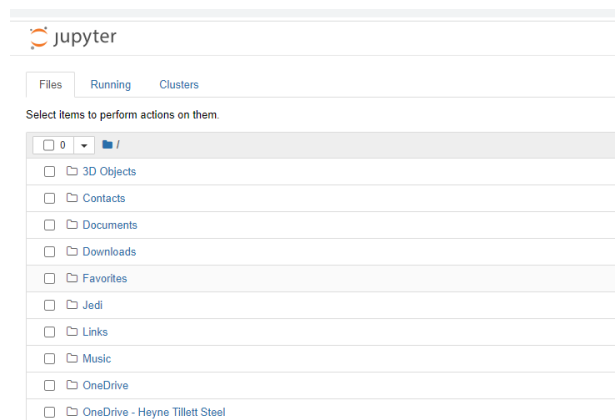

Example

```
In [2]: print('The timber type is:')
print(timber_type)
```

The timber type is:
C24 Softwood

This section requires the above to work

VS Code

VS Code is the recommended Integrated Developer Environment (IDE) to create project scripts in Python.

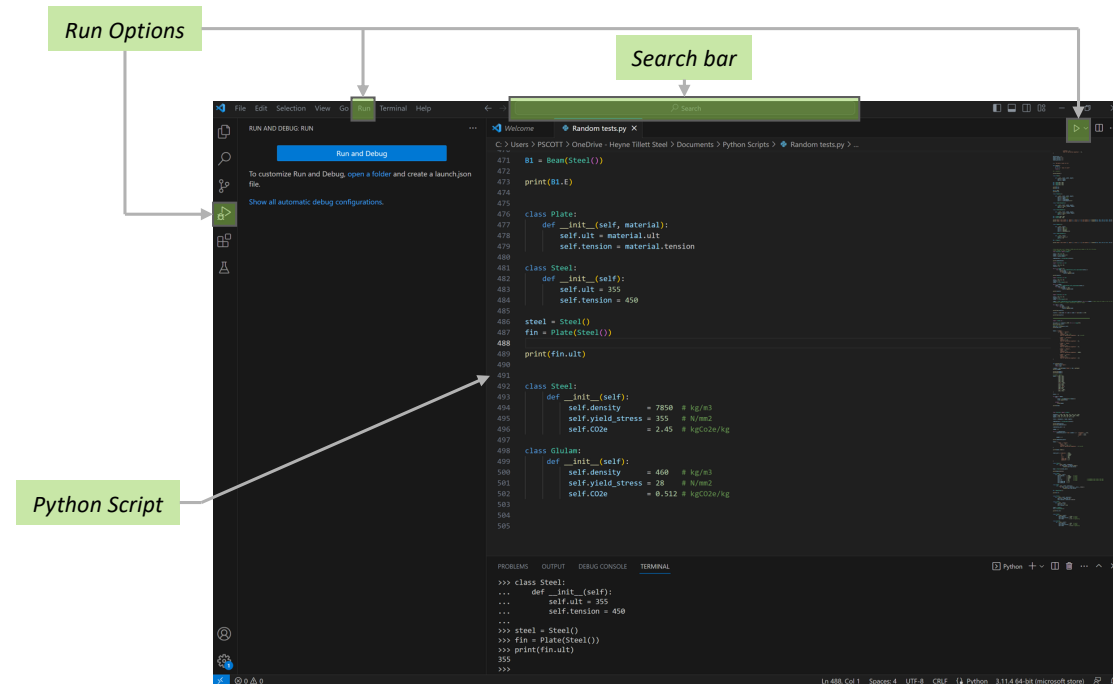

While Jupyter is great for tutorials and the like, VS Code is far more flexible and friendly towards building working tools.

- + To get started, Open via Windows Search or Anaconda Navigator.
- + Next, Install the latest version of Python from the Microsoft Store.
- + Finally, in VS Code, navigate to the search bar at the top, enter '> Python: Select Interpreter', and choose the version of Python you just installed.
- + Et voila, you are ready to code in Python.

To Run a script in VS Code, you may:

- + Use the 'Run' tab of the toolbar
- + Right-click your script and select 'Run Python'
- + Click the Run button in the top right
- + Use Run and Debug on the left-hand-side of your screen.

See 'Additional Notes on VS Code' for more information.
